

analysis\_pcap\_arp.py: This program requires the dpkt program to be installed via pip. Python 3.0+ is recommended. Below Python 3.0 has not been tested. To run, type in python3 analysis\_pcap\_arp.py in your preferred terminal. This will prompt you put in a file. Please for this program to work, you must put in a file name that's in the same directory as this python file or give in the full path to the file. This must be a PCAP file. This program works by taking the first request then finding the first reply to that quest. After getting this request and reply, it prints out each thing by using specific bytes from the buffer that was passed. This will allow the program to correctly output everything in a clean and neat way.
